Project Proposal Year IV

Student Name:	Mikey Holmes	Student Number:	C00300796
Working Title:	Void Monitor: Interactive Space Interface		
Description:	“Void Monitor: Interactive Space Interface” is a 3D interactive terminal experience created in Unity. The project will be set inside the cockpit of a deep-space ship, this is where the user can interact with different screens and terminals around the room using a point and click interface. This project will focus on UI design, 3D environment layout, interactive screen feedback and visual lighting. The user will be in a fixed position in the cockpit but will be able to switch to different camera views and interact with the different ship systems. The main interactive features I plan to build are: 1. Navigation & Sector map: A main display screen where the user can click on different planets or stars on a 2D map. By selecting the destination, the user will then see the selected planet or star outside the ship. The user can also go for a close up view of the planet/star and see what it looks like from the surface. Interaction Result: Clicking a planet on the map switches the active camera view toward the window, changes the 3D skybox outside to show the planet selected, and it also opens a 2D HUD panel with planet stats. 2. Ship lighting & Alert Switcher: A control panel on the console that will let the user change the overall mood and status of the ship. Such as Normal, Stealth, or Red alert. Toggling these will change the lighting inside the ship in real time. Interaction Result: Toggling these buttons updates the real-time lighting colours and glowing terminal materials inside the cockpit immediately. 3. Ship Diagnostics & Logs: A side terminal which will have interactive HUD gauges for ship status such as oxygen levels, engine temperature and shield integrity. The user can toggle switches to trigger visual feedback. Interaction Result: Clicking switches updates animated status gauges on screen, and selecting a log file creates a text pop-up		
Reasons for selecting project:	Learning Unity Tools: I want to use this project as a chance to get better at Unity. I don't have much experience with Unity although I feel it would be a good experience to learn how to use it. By using Unity I will be able to improve my 3D art skills, I feel that I lack in this area and it is something I've always wanted to be good at. Creating the assets in this game

	will make me much more comfortable in the 3D art space. I think that Interactive UI and 3D environments are great things to show off in a portfolio, this idea I want to create is very creative and I feel that it is quite unique so it will stand out. Why Unity over 2D engines like Phaser: I chose Unity over Phaser because my project relies on diegetic UI, this means the interface screens will exist physically inside a 3D cockpit. Unity will allow me to use real-time 3D lighting, post processing glows, and 3D camera transitions in between the terminals. This would not work in 2D engines such as phaser.

Project Proposal Year IV

Software requirements:	Unity Engine Unity Hub Adobe Illustrator / Figma Adobe Photoshop VS Code (when scripting is necessary) Github Github desktop Maya (possibly)
Other requirements:	
Action Taken:	Engine Justification: I kept Unity as my main engine and added a section explaining why it is better suited for this project than a 2D engine like Phaser. Since the project relies on diegetic UI inside a 3D cockpit, Unity is the better option. Clearer Interaction: I updated the description for all three main features, to explain exactly what happens when the user clicks on different screens and buttons. I kept the project scope small and focused on just three point and click terminal stations in the cockpit.
